

Otim Sweep Actions Review

I conducted a 3 day review of 5 new actions and a price feed contract based on chainlink for Otim's smart wallet. The actions reviewed were SweepAction, SweepERC20Action, SweepCCTPAction, TransferCCTPAction, and SweepUniswapV3Action. The sweep action variants preform a specific action when the account reaches a threshold of value, such as sending assets to another account or trading. The CCTP actions enable using the circle bridge to natively transfer assets cross chain. These actions share libraries with previously reviewed features. The review was preformed from commit `c4db4fb`.

Disclaimer: Security review is performed on a best effort basis and some bugs may remain.

About The Team

Aleph_v is a former mathematician and current cryptographer and security researcher with 7 years of experience preforming security reviews and finding critical bugs for clients across the blockchain and cryptography industries.

Findings

Summary: Critical: 0, High: 0, Medium: 0, Low: 0

Findings are presented chronologically:

Notes

Very low severity, performance notes, or other non-issue comments

- `lastRoundData` could return improperly mixed data from different price feeds, but the mixed returns are not used so I would recomend removing them.
